01 Software development and AI opportunities

Dear Hiring Manager,

I bring experience in full-stack software development, consulting, and UI/UX, alongside an interest in practical AI tools. I am looking for an opportunity where I can contribute technical skills, sound judgment, and clear communication.

Through freelance development on Upwork and consulting with BISON ONWARD CONSULTING CENTER LLC, I built web applications, implemented front-end features, and supported system integrations. My experience includes React, Next.js, Node.js, Python, FastAPI, and GraphQL. I enjoy turning requirements into software that is useful and straightforward to use.

During my time leading Skyline Dynamics Inc., I worked with clients to define scope, plan implementation, and coordinate delivery. This included interface work and front-end/back-end integrations across healthcare and real estate, as well as payment-related back-end work in the automotive sector. These projects strengthened my ability to connect technical work with business needs.

My AI Study Companion project brings together document processing, retrieval, speech recognition, and image processing in a browser-based study tool. It produces source-linked summaries, questions, and flashcards so users can check outputs against their material. Building it has reinforced my interest in AI applications and careful evaluation of their results.

I am completing a BSc in Computer Science at the University of London, with graduation expected in December 2026. My UI/UX internship, freelance 3D design work, and certifications from Google and IBM add a practical design and learning perspective to my development background.

You can explore my work at lukodevelops.pages.dev. I would welcome the opportunity to discuss how my development skills, attention to detail, and client-facing experience could support your team. Thank you for your consideration.

Sincerely,

Lukas Zemolochinas
